

Problem B: Between Ceiling and Floor

Time Limit: 5 seconds

Description

Given positive integers m and k , let $f(x, y) = x \lfloor y \sqrt{k} \rfloor - y \lfloor x \sqrt{k} \rfloor$, compute the number of positive integer pairs such that $f(a, b) = m$, $f(a - b, b) \neq m$, and $f(a, b - a) \neq m$ hold simultaneously.

Input

A number of inputs (≤ 1000) described as follows.

Each input is just a single line with m and k ($0 < m, k \leq 10^{18}$).

Output

For each input, output a line with the number of pairs.

Sample Input

3 4

3 5

Sample Output

0

4
